

Automatic Trailer Tracking using Electronic Serial Numbers & PLC

Automatic location tracking of your trailers is now available using Electronic Serial Numbers on your trailer. The Wheel Monitor Electronic Serial Number Identification System is the lowest cost solution for automatic trailer tracking and identification, tethered or untethered. Our tractor module has PLC4Trucks, Power Line Communication and a built in RS232 serial port to provide trailer information to a cab mounted communication link. A perfect addition to any asset tracking system, it works in real-time and for data loggers. The location of all trailers updated to your computer for tighter control and dependable asset management.

Power Line Carrier communications works on existing wiring. No extra wiring is needed between the cab and the trailer, just the current J560 connector. No antennas required. Each trailer module will send a unique electronic serial number forward to the cab automatically. The system will identify up to five trailers and tractor hauling them. Installation is easy, mount the module with two screws and connect two wires to the harness or in the back of SAE-J560 connector. The module may be mounted anywhere on the trailer. Works for dollies too!

Features

- Unique Serial Number for Every Trailer
- Unique Serial Number for Every Tractor
- Automatic, NO MANUAL CONTROLS.
- Multiple Trailers Identified
- Serial Communications
- Power Line Communications, PLC4Trucks
- SAE-J1455 Environmental Design
